

A comprehensive advisory program for the period through to 1975 is being prepared. This is a complex problem and it will not be available for the election, remaining. However certain rules of thumb have come to light.

- 1) Process Samples H → D Large Scale Canada now →
at min run level.
- 2) Process 99% Samples at W.T.
- 2) Process B.W. Waste.
- 3) Process BAT Polymery Waste

This will enable us to answer the questions for Canada as soon as we can will keep Bow happy!! and with BAT (smery) and B.W. stand the rank in the acceptability of the waste plant.

Various Conventional Tobacco of various types should follow immediately on this and the substitution of the R.P.S. for V.G. Tob can then be looked at by both S.T.O. & B.I.S.
