Dr. P. S. S. S.

May I draw your attention to one point in his report of Sisney which may cause a little confusion. Sisney quotes Smoulder rates as ~~mm~~^{seconds}/30 mm and in R.T.E. we quote Smoulder rates as mm/minute. This leads to what appears to be opposite conclusions on page 4.

I have attached some quickly drawn graphs to illustrate this. Sisney's smoulder rates are a lot faster than I found, back in about 1961, when I did his work but this is probably not likely to be because of different tobacco and porosity of the paper.
