Report : RD.1114-R

This first report on inhalation toxicology describes the development of respiratory monitoring techniques for a number of rodent species. It includes preliminary measurements on the acute effects of smoke on various respiratory characteristics.

Although the results are not important in themselves, this is the first report of in vivo work undertaken by GR & DC, albeit at the Wickham laboratory.

For this reason, I am sending three copies in case you should wish to circulate the report in Millbank.

If you wish, an additional copy of the report could be made available for you to send to Bristol.

A.R. Evelyn
