DATE 31st May, 1974.

REPORT NO. RD.1109-R

"A Smoking Survey within Group R. & D. Centre"

*RD1109-R*

This ~~interim~~ report describes the first stage in the analysis of the results from the smoking survey currently being carried out at Southampton.

This is our first attempt to survey the smoking habits of a reasonably large population (some 120 smokers at ~~the~~ *C.R.D.C.* Group Research and Development Centre).

To date, the smoking habits of some 110 of these subjects have been recorded, and this report describes a preliminary analysis of the results of 61 subjects who chose to smoke a KSFT cigarette.

The smoking habits were measured with the Southampton puff analyser. This was the first experiment in which this equipment has been used and, in general, its reliability has been acceptable.

*S: f-1.*

The ~~report shows that the average results, for some parameters (notably puff volume) are close to those used in machine smoking. However, there are numerous qualifications which must be put on these interim results, and a more detailed analysis will follow when the experiment is complete.~~

~~I would suggest that this report is given a limited circulation in Millbank and that copies are not sent to I.T.L.~~
