Report RD.1109-R describes the first stage in the analysis of the results from the smoking survey currently being carried out at Southampton.

This is our first attempt to survey the smoking habits of a reasonably large population (some 120 smokers at G.R & D.C.).

To date, the smoking habits of some 110 of these subjects have been recorded, and this report describes who chose to smoke a KSFT cigarette.

The smoking habits were measured with the Southampton puff analyser. This was the first experiment in which this equipment has been used and, in general, its reliability has been acceptable.

The average results so far, for puff volume, are close to those used in machine smoking.
