SELECTIVE FILTRATION PROGRESS REPORT

(Report No. RD.365-R)

SUMMARY AND CONCLUSIONS

The removal of 70 - 90% of those smoke constituents chosen for study in the selective filtration programme, with the exception of carbon monoxide, is now possible using various filter designs, such as dual or triple filters incorporating a variety of materials such as carbon, polyethyleneimine, polyethylene glycol, etc. The pilot-scale manufacture, bioassay, and subjective testing of the most effective filters is in progress.
